

DR. MELVIN H. PROCELL

ANNOUNCES

New ORTHOPHOS® XG 3D X-Ray

The CT technology provides detailed, precise data in a 3D format that can be rotated 360 degrees. The unit is precisely tailored to the private dental practice, displaying the patient's whole jaw using a comfortable scan that takes only seconds.

As Dr. Procell goes through the software with patients, they see their own mouth in 3D and really understand why a particular type of treatment is recommended. The system benefits the patient in all phases of dentistry. The 3D scan is very significant in uncovering anatomical conditions not apparent in 2D x-ray. "We're seeing things we couldn't see before".

This added dimension makes the diagnosis and implant treatment safer, more precise and predictable.

Dr. Procell's system provides a three dimensional image of the patient on the computer screen and the surgery is performed virtually for the patient review. Then at the time of treatment customized guides specific to the patient and the case assist with accurate implant placement. This allows for faster more comfortable surgery.

Having over 20 years experience in placing dental implants, Dr. Procell sees 3D imaging as one of the best advancements for patient care. This new service enhances our ability to restore a healthy bite and smile through single and multiple tooth replacements. Patients without any teeth can enjoy the benefits of Snap-on dentures as well as the new Lock-on hybrid denture.
